Table 1: Timing of recorded events relative to T2DM diagnosis (index day = 0). For each `_days` variable we report completeness, the median time in days with IQR, and the distribution of occurrences before (≤ 0), at ($= 0$), and after (> 0) the index among those observed.

variable	observed	missing	observed %	median_days [Q1;Q3]	≤ 0 n (%)	$= 0$ n (%)	> 0 n (%)

Dialysis	1151	35095	3.2	206.7 [7.1; 1139.4]	0 (0.0%)	0 (0.0%)	1151 (100.0%)

Notes. Times are counted in days from the index date (T2DM diagnosis, day 0). “observed” = number of non-missing values; “observed %” = $100 \times \text{observed} / N$. “median_days [Q1;Q3]” is computed among observed values only. Columns ≤ 0 , $= 0$, and > 0 report counts (percentages) among observed values occurring before, on, and after the index, respectively. For `death_days` and `dialysis_days`, events occur after index in this dataset. For diagnosis/therapy variables (e.g., `has_days`, `dlp_days`, `dcv_days`, `ieca_bra_days`), values ≤ 0 indicate presence at baseline (prevalent condition/therapy), and > 0 incident after index. Abbreviations: CVD = Cardiovascular or Cerebrovascular Disease; CKD = Chronic Kidney Disease; ACEi = Angiotensin Converting Enzyme inhibitors; ARB = Angiotensin Receptor Blocker.

Table 2: Timing of laboratory measurements relative to T2DM diagnosis (index day = 0).
